

## SIMATS ENGINEERING ASSESSMENT TOOL 3

**COURSE NAME: Artificial Intelligence    COURSE CODE: CSA17**

---

### **COURSE OUTCOME COVERED**

**CO3:** *Analyze knowledge representation and reasoning using propositional logic, FOL, inference, resolution, chaining methods, knowledge representation to perform logical reasoning for drawing valid conclusions and decision making. (BL4)*

*Assessment Tool Weightage: 50%*

---

**QUESTIONS: 30**

**Time Duration: 30 Minutes  
Total Marks:30**

Annexure A

**MCQ**

---

### ***Code of Conduct:***

***I JEROLIN MARY R (192411024) (Name / Reg No) certify that this submission is my original work and that I have adhered to the guidelines specified for this assessment.  
I understand that any violation of academic integrity rules will result in disciplinary action.***

## Annexure A

Circle the most appropriate option for each question.

**Q1.** Which of the following best describes a Logical Agent in AI?

- |                                                                                |                                                   |
|--------------------------------------------------------------------------------|---------------------------------------------------|
| a) An agent that reacts randomly to the environment                            | c) An agent that only follows pre-defined scripts |
| b) An agent that uses a knowledge base and logical inference to decide actions | d) An agent that learns from rewards              |

**Q2.** In Propositional Logic, ' $P \rightarrow Q$ ' is logically equivalent to:

- |                      |                                     |
|----------------------|-------------------------------------|
| a) $P \wedge \neg Q$ | c) $\neg Q \rightarrow \neg P$ only |
| b) $\neg P \vee Q$   | d) Both b and c                     |

**Q3.** Conjunctive Normal Form (CNF) requires the formula to be expressed as:

- |                                            |                                   |
|--------------------------------------------|-----------------------------------|
| a) A disjunction of conjunctions           | c) A conjunction of literals only |
| b) A conjunction of disjunctions (clauses) | d) A sequence of implications     |

**Q4.** In FOL, the sentence  $\forall x: \text{Student}(x) \rightarrow \text{Passes}(x)$  means:

- |                                          |                                                 |
|------------------------------------------|-------------------------------------------------|
| a) Some students pass                    | c) If something passes, it is a student         |
| b) Every entity that is a student passes | d) There exists at least one student who passes |

**Q5.** Unification in FOL is the process of finding substitutions that:

- |                                                         |                                         |
|---------------------------------------------------------|-----------------------------------------|
| a) Convert clauses to CNF                               | c) Prove a goal using backward chaining |
| b) Make two logical expressions syntactically identical | d) Derive facts using Modus Ponens      |

**Q6.** In the Resolution algorithm, deriving the empty clause  $\square$  indicates:

- |                                     |                                                  |
|-------------------------------------|--------------------------------------------------|
| a) The knowledge base is consistent | c) A contradiction — the original goal is proven |
| b) The negated goal is satisfiable  | d) More clauses need to be added                 |

**Q7.** Forward Chaining is best described as a \_\_\_\_\_ strategy.

- |                            |                                |
|----------------------------|--------------------------------|
| a) Goal-driven / top-down  | c) Heuristic-based depth-first |
| b) Data-driven / bottom-up | d) Probabilistic inference     |

**Q8.** Backward Chaining begins reasoning from:

- |                                                           |                                          |
|-----------------------------------------------------------|------------------------------------------|
| a) All known facts toward a conclusion                    | c) A random clause in the knowledge base |
| b) The goal and works backward to verify supporting facts | d) The resolution refutation tree        |

**Q9.** Which step is NOT part of converting a sentence to CNF?

- |                                                   |                                                          |
|---------------------------------------------------|----------------------------------------------------------|
| a) Eliminate biconditionals ( $\leftrightarrow$ ) | c) Apply Skolemization to remove existential quantifiers |
| b) Move negations inward using De Morgan's laws   | d) Distribute AND over OR                                |

**Q10.** Knowledge Engineering in FOL involves:

- |                                                                    |                                                         |
|--------------------------------------------------------------------|---------------------------------------------------------|
| a) Training a neural network on domain-specific data               | c) Writing heuristic search strategies                  |
| b) Defining domain concepts, relations, and axioms formally in FOL | d) Encoding reward functions for reinforcement learning |

**Q11.** Modus Ponens states: If  $P \rightarrow Q$  is known and P is true, then:

- |                     |                           |
|---------------------|---------------------------|
| a) $\neg Q$ is true | c) P is uncertain         |
| b) Q must be true   | d) The KB is inconsistent |

**Q12.** The Most General Unifier (MGU) is the substitution that:

- |                                        |                                           |
|----------------------------------------|-------------------------------------------|
| a) Is the most specific possible match | c) Eliminates all variables from a clause |
|----------------------------------------|-------------------------------------------|

b) Makes two terms identical with minimal variable binding

d) Applies resolution to produce CNF

**Q13.** Which inference method is more appropriate when a specific goal is known?

a) Forward Chaining

c) Backward Chaining

b) Truth Table method

d) A\* search

**Q14.** Propositional Logic differs from First Order Logic because it:

a) Supports probabilistic reasoning

c) Is always more expressive

b) Cannot represent objects, relations, or quantifiers — only truth values of atomic propositions

d) Handles uncertainty better

**Q15.** Resolution Refutation proves a goal G by:

a) Directly deriving G from the KB using forward chaining

c) Checking G in the truth table

b) Adding  $\neg G$  to the KB and deriving a contradiction (empty clause  $\square$ )

d) Applying Modus Tollens repeatedly

**Q16.** Learning from observation in AI refers to:

a) An agent receiving numerical rewards from the environment

c) Acquiring knowledge by following explicit symbolic rules

b) Improving performance by examining examples or experience from the environment

d) Memorizing a fixed dataset without generalization

**Q17.** Inductive learning is best described as:

a) Deriving specific conclusions from general rules

c) Memorizing training data exactly

b) Generalizing a hypothesis from specific training examples

d) Applying search algorithms to find optimal policies

**Q18.** In a Decision Tree, what does each internal node represent?

- |                                             |                                     |
|---------------------------------------------|-------------------------------------|
| a) A class label / output decision          | c) A test on an attribute / feature |
| b) A probability distribution over outcomes | d) A training data sample           |

**Q19.** Explanation-Based Learning (EBL) differs from inductive learning because it:

- |                                                          |                                                                           |
|----------------------------------------------------------|---------------------------------------------------------------------------|
| a) Requires large amounts of training data to generalize | c) Uses prior domain knowledge to explain and generalize a single example |
| b) Learns only from numeric data using regression        | d) Applies unsupervised clustering to find hidden patterns                |

**Q20.** In statistical learning, a Naive Bayes classifier assumes:

- |                                                                           |                                                                     |
|---------------------------------------------------------------------------|---------------------------------------------------------------------|
| a) All features are conditionally dependent on each other given the class | c) All features are conditionally independent given the class label |
| b) The data must follow a uniform distribution                            | d) Labels are determined by a reward function                       |

**Q21.** Learning with complete data (no hidden variables) in a Bayesian network involves:

- |                                                               |                                                                       |
|---------------------------------------------------------------|-----------------------------------------------------------------------|
| a) Using the EM algorithm to estimate missing values          | c) Directly computing maximum likelihood estimates from observed data |
| b) Training a deep neural network with dropout regularization | d) Applying reinforcement signals to update weights                   |

**Q22.** The Expectation-Maximization (EM) algorithm is used when:

- |                                                                   |                                                                                    |
|-------------------------------------------------------------------|------------------------------------------------------------------------------------|
| a) Training data is fully labeled and no variables are hidden     | c) The dataset contains hidden (latent) variables that cannot be directly observed |
| b) An agent explores an unknown environment using trial and error | d) Backpropagation fails to converge in a neural network                           |

**Q23.** In a Neural Network, the activation function serves to:

- |                                                  |                                                                   |
|--------------------------------------------------|-------------------------------------------------------------------|
| a) Initialize the weights of each neuron to zero | c) Introduce non-linearity to enable learning of complex patterns |
| b) Normalize the input dataset before training   | d) Store previously learned examples in memory                    |

**Q24.** Which of the following correctly describes backpropagation in a neural network?

- |                                                                  |                                                                                   |
|------------------------------------------------------------------|-----------------------------------------------------------------------------------|
| a) Weights are updated in the forward pass using input gradients | c) The error is propagated backward from output to input layers to adjust weights |
| b) Outputs of each layer are stored and reused in later epochs   | d) A separate model is trained for each hidden layer independently                |

**Q25.** A Support Vector Machine (SVM) — a type of kernel machine — classifies data by:

- |                                                               |                                                                 |
|---------------------------------------------------------------|-----------------------------------------------------------------|
| a) Minimizing the number of training examples used            | c) Finding the maximum-margin hyperplane that separates classes |
| b) Grouping similar data points into clusters using centroids | d) Updating weights using Q-values from an environment          |

**Q26.** The kernel trick in kernel machines (SVMs) allows:

- |                                                  |                                                                                           |
|--------------------------------------------------|-------------------------------------------------------------------------------------------|
| a) Reducing the number of support vectors needed | c) Operating in a high-dimensional feature space without explicitly computing coordinates |
| b) Accelerating gradient descent convergence     | d) Replacing hidden layers in a deep neural network                                       |

**Q27.** In Reinforcement Learning, the agent aims to maximize:

- |                                                           |                                                                                  |
|-----------------------------------------------------------|----------------------------------------------------------------------------------|
| a) Classification accuracy on a fixed test set            | c) Cumulative reward received over time through interaction with the environment |
| b) The number of features selected from the training data | d) The size of the neural network hidden layer                                   |

|                                                                                  |                                                                 |
|----------------------------------------------------------------------------------|-----------------------------------------------------------------|
| <b>Q28.</b> The Q-Learning algorithm in Reinforcement Learning is classified as: |                                                                 |
| a) A supervised learning algorithm requiring labeled datasets                    | c) A model-free, off-policy temporal difference learning method |
| b) An unsupervised clustering technique using centroids                          | d) A decision-tree-based ensemble classifier                    |

|                                                             |                                                                                |
|-------------------------------------------------------------|--------------------------------------------------------------------------------|
| <b>Q29.</b> Overfitting in machine learning occurs when:    |                                                                                |
| a) The model performs poorly on both training and test data | c) The model fits training data too closely and generalizes poorly to new data |
| b) The learning rate is set too low during gradient descent | d) The training set has more features than training examples                   |

|                                                                                                        |                                                                                        |
|--------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------|
| <b>Q30.</b> Which of the following best distinguishes Reinforcement Learning from Supervised Learning? |                                                                                        |
| a) RL uses labeled input-output pairs; SL uses reward signals                                          | c) RL learns via trial-and-error with reward feedback; SL learns from labeled examples |
| b) Both RL and SL require explicit reward functions                                                    | d) RL is always faster to converge than SL on any dataset                              |

## RUBRICS FOR CALCULATION

| Criteria                 | Weightage (%) | Level 4 (Exemplary)                                                   | Level 3 (Proficient)                         | Level 2 (Developing)                               | Level 1 (Beginning)                                |
|--------------------------|---------------|-----------------------------------------------------------------------|----------------------------------------------|----------------------------------------------------|----------------------------------------------------|
| Conceptual Understanding | 30%           | Demonstrates thorough understanding; answers all questions accurately | Shows good understanding with few errors     | Partial understanding; several incorrect responses | Lacks understanding; majority of answers incorrect |
| Accuracy of Answers      | 25%           | All answers are correct                                               | Most answers are correct with minor mistakes | Some correct answers; frequent errors              | Mostly incorrect answers                           |
| Application of Knowledge | 20%           | Correctly applies concepts to                                         | Applies concepts with minor errors           | Limited ability to apply concepts                  | Unable to apply concepts                           |

|                         |     |                                                               |                                     |                                                 |                                      |
|-------------------------|-----|---------------------------------------------------------------|-------------------------------------|-------------------------------------------------|--------------------------------------|
|                         |     | problem-based questions                                       |                                     |                                                 |                                      |
| Time Management         | 15% | Completes quiz well within time efficiently                   | Completes on time with minor delays | Requires extra time or rushes through questions | Unable to complete within given time |
| Question Interpretation | 10% | Interprets all questions correctly and responds appropriately | Misinterprets a few questions       | Often misinterprets questions                   | Unable to understand questions       |

## ANSWER

| Q.No | Option | Answer                                                                                       |
|------|--------|----------------------------------------------------------------------------------------------|
| 1    | b      | An agent that uses a knowledge base and logical inference to decide actions                  |
| 2    | d      | Both $\neg P \vee Q$ and $\neg Q \rightarrow \neg P$                                         |
| 3    | b      | A conjunction of disjunctions (clauses)                                                      |
| 4    | b      | Every entity that is a student passes                                                        |
| 5    | b      | Make two logical expressions syntactically identical                                         |
| 6    | c      | A contradiction — the original goal is proven                                                |
| 7    | b      | Data-driven / bottom-up                                                                      |
| 8    | b      | The goal and works backward to verify supporting facts                                       |
| 9    | c      | Apply Skolemization to remove existential quantifiers                                        |
| 10   | b      | Defining domain concepts, relations, and axioms formally in FOL                              |
| 11   | b      | Q must be true                                                                               |
| 12   | b      | Makes two terms identical with minimal variable binding                                      |
| 13   | c      | Backward Chaining                                                                            |
| 14   | b      | Cannot represent objects, relations, or quantifiers—only truth values of atomic propositions |
| 15   | b      | Adding $\neg G$ to the KB and deriving a contradiction (empty clause $\square$ )             |

|    |   |                                                                                        |
|----|---|----------------------------------------------------------------------------------------|
| 16 | b | Improving performance by examining examples or experience from the environment         |
| 17 | b | Generalizing a hypothesis from specific training examples                              |
| 18 | c | A test on an attribute / feature                                                       |
| 19 | c | Uses prior domain knowledge to explain and generalize a single example                 |
| 20 | c | All features are conditionally independent given the class label                       |
| 21 | c | Directly computing maximum likelihood estimates from observed data                     |
| 22 | c | The dataset contains hidden (latent) variables that cannot be directly observed        |
| 23 | c | Introduce non-linearity to enable learning of complex patterns                         |
| 24 | c | The error is propagated backward from output to input layers to adjust weights         |
| 25 | c | Finding the maximum-margin hyperplane that separates classes                           |
| 26 | c | Operating in a high-dimensional feature space without explicitly computing coordinates |
| 27 | c | Cumulative reward received over time through interaction with the environment          |
| 28 | c | A model-free, off-policy temporal difference learning method                           |
| 29 | c | The model fits training data too closely and generalizes poorly to new data            |
| 30 | c | RL learns via trial-and-error with reward feedback; SL learns from labeled examples    |
